

Ergonomics Evaluation Report

Posture Analysis

- Neck Flexion: Yellow
- Shoulder Elevation: Green
- Elbow Angle: Red
- Wrist Deviation: Yellow
- Pelvic Tilt: Yellow

Workstation Analysis

Pain & Risk Summary

Average Pain Level: 6

Main Pain Region(s): Elbows/Forearms (VAS 8)

Posture & Ergonomic Corrections

- Reduce neck flexion to under 10°: Sit upright and adjust your gaze so your neck bends no more than 10° forward. This aligns with ISO 9241-5, minimizing neck strain and reducing upper back discomfort.
- Bend elbows to 90-100° angle: Bring your forearms closer to your body so your elbows form a 90-100° angle. This reduces excessive extension, lowering strain on wrists and upper back per ISO 9241-5.
- Keep wrists straight within 5° deviation: Position your hands so your wrists remain straight, with less than 5° sideways or upward bend. This helps prevent tingling and stiffness in wrists/hands.
- Maintain neutral pelvic tilt under 5°: Sit with your hips level and avoid slouching to keep pelvic tilt under 5°, supporting your lower and upper back.
- Raise laptop screen by 5 cm: Use a stable riser to elevate your laptop screen by 5 cm, bringing it closer to eye level and reducing neck flexion.
- Move keyboard 10 cm closer: Position your external keyboard 10 cm closer to your body to achieve a 90-100° elbow angle, reducing upper back and wrist strain.
- Use external mouse at elbow height: Place an external mouse at the same height as your keyboard and elbow, keeping your wrist straight and minimizing deviation.

Final Advice

Your current setup poses a high risk for neck, upper back, and wrist strain. Prioritize raising your laptop screen, using an external keyboard and mouse, and adjusting your posture to reduce pain and prevent further issues. Perform recommended exercises regularly and consider ergonomic equipment for significant improvement.
