

Ergonomics Evaluation Report

Posture Analysis

- Neck Flexion: Red risk
- Shoulder Elevation: Green risk
- Elbow Angle: Red risk
- Wrist Deviation: Red risk
- Pelvic Tilt: Yellow risk

Workstation Analysis

Posture & Ergonomic Corrections

- Reduce Neck Flexion: Sit upright with your head aligned over your shoulders. Adjust your gaze so your eyes are level with the top third of your monitor, minimizing the need to bend your neck forward.
- Correct Elbow Angle: Position your elbows so they are bent at approximately 90–100 degrees and close to your body. Avoid extending your arms forward or outward while typing or using the mouse.
- Neutral Wrist Position: Keep your wrists straight and in line with your forearms when typing or using the mouse. Avoid bending your wrists up, down, or to the sides.
- Raise Monitor Height: Elevate your monitor so the top edge is at or just below eye level. Use a monitor riser or stable books to achieve the correct height, reducing neck flexion.
- Adjust Keyboard and Mouse Placement: Position your keyboard and mouse so they are close to the edge of your desk and at elbow height. This helps maintain a neutral elbow angle and reduces wrist deviation.
- Optimize Chair Height and Support: Adjust your chair so your feet are flat on the floor and your hips are slightly higher than your knees. Use a lumbar support cushion if needed to maintain a slight pelvic tilt.

Final Advice

Your current workstation setup is causing significant strain, especially to your upper back and neck. Immediate ergonomic adjustments and regular exercises are essential. If pain persists or worsens, consult a healthcare professional.
