

Ergonomics Evaluation Report

Posture Analysis

- Neck Flexion: Red risk
- Shoulder Elevation: Yellow risk
- Elbow Angle: Red risk
- Wrist Deviation: Red risk
- Pelvic Tilt: Red risk

Workstation Analysis

Posture & Ergonomic Corrections

- Reduce Neck Flexion: Sit upright with your head balanced over your shoulders, keeping your chin level. Avoid bending your neck forward; your monitor should be at eye level to minimize neck flexion.
- Correct Shoulder Elevation: Relax your shoulders and keep them level, not hunched or raised. Adjust your chair and armrests so your shoulders remain in a neutral, relaxed position.
- Optimize Elbow Angle: Position your elbows at a 90–110° angle, close to your body. Adjust your chair height and keyboard position so your forearms are parallel to the floor.
- Minimize Wrist Deviation: Keep your wrists straight and in line with your forearms while typing or using the mouse. Avoid bending your wrists up, down, or sideways.
- Neutral Pelvic Tilt: Sit with your hips and pelvis in a neutral position, not tilted forward or backward. Use a chair with good lumbar support to maintain the natural curve of your lower back.
- Raise Monitor Height: Elevate your monitor so the top of the screen is at or just below eye level. This will help reduce neck flexion and prevent forward head posture.
- Adjust Chair and Armrests: Set your chair height so your feet are flat on the floor and your thighs are parallel to the ground. Adjust armrests so your shoulders are relaxed and elbows are supported at a 90–110° angle.
- Keyboard and Mouse Placement: Place your keyboard and mouse close to your body and at the same height as your elbows. This will help maintain neutral wrist and elbow positions.
- Lumbar Support: Ensure your chair provides adequate lumbar support to maintain a neutral pelvic tilt and support your lower back.

Final Advice

Your assessment shows significant ergonomic risks, especially for your shoulders and wrists. Prioritize workstation adjustments and posture corrections to reduce discomfort and prevent further strain. Incorporate the recommended exercises and consider the suggested equipment for optimal support.
