Ergonomics Evaluation Report

Posture Analysis

- Neck Flexion: Yellow
- Shoulder Elevation: Yellow
- Elbow Angle: Red
- Wrist Deviation: Yellow
- Pelvic Tilt: Red

Workstation Analysis

- Monitor: MonitorHeight: Red
- Monitor: ViewingDistance: Green

Pain & Risk Summary

Average Pain Level: 7

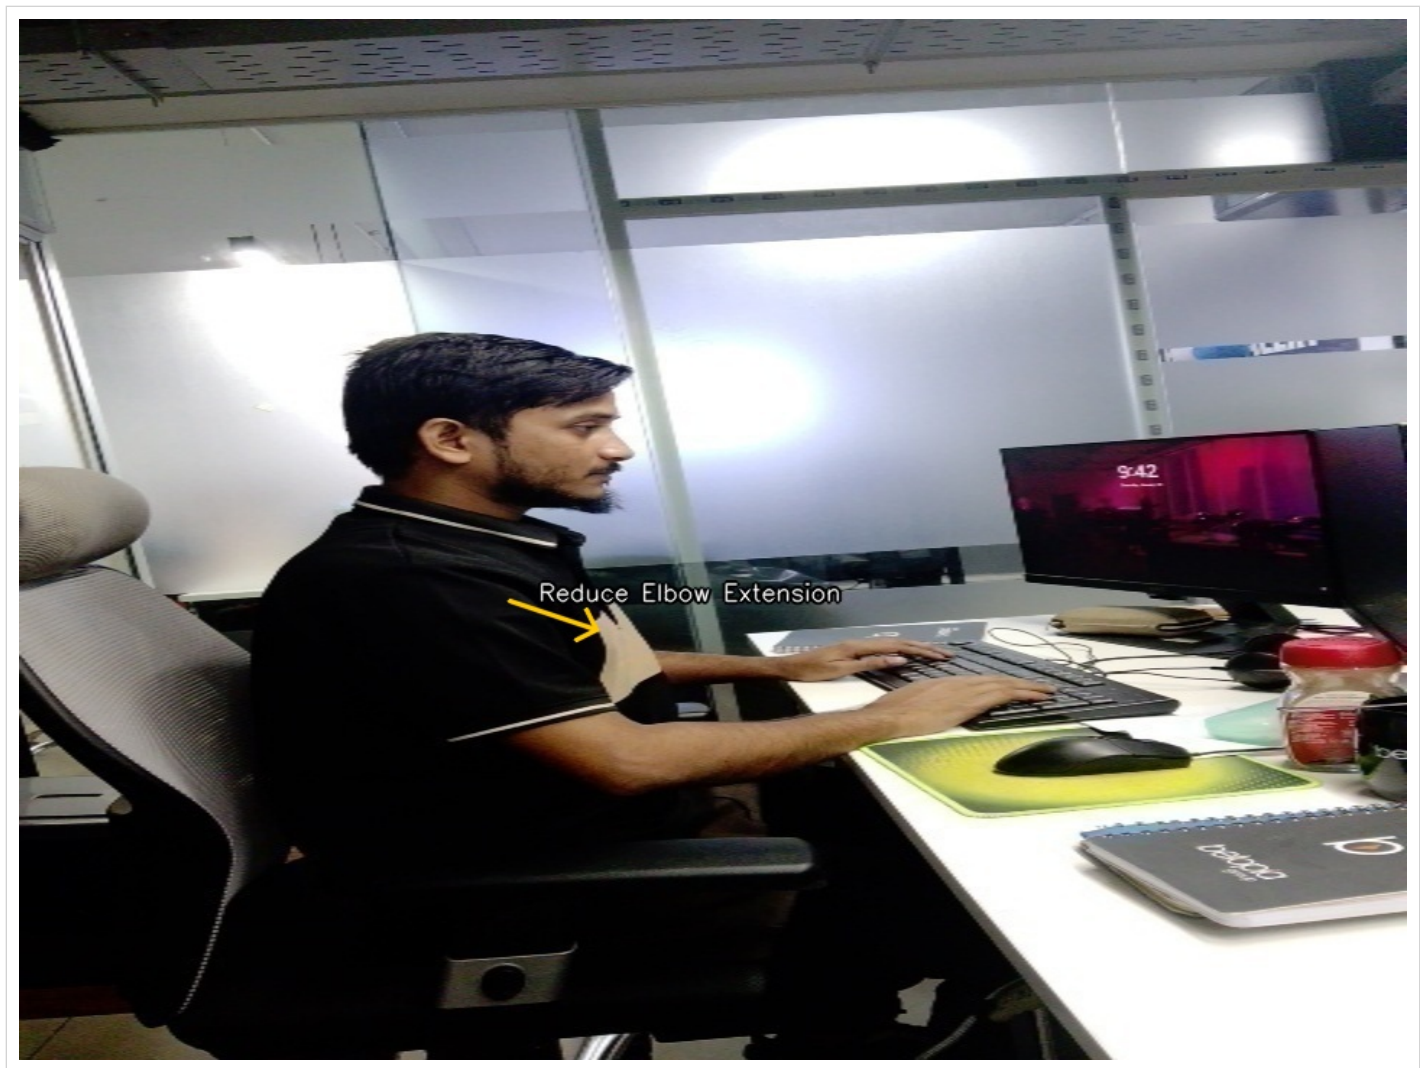

Main Pain Region(s): Neck, Elbows/Forearms, Hips/Glutes (VAS 8)

Posture & Ergonomic Corrections

- Correct Elbow Angle: Adjust your sitting position so that your elbows are bent at approximately 90–100°, keeping your forearms parallel to the floor and close to your body. Avoid extending your arms forward, which increases strain on your upper back and wrists.
- Neutral Pelvic Position: Sit with your pelvis in a neutral position by ensuring your hips are level and your lower back is supported. Avoid slouching or tilting your pelvis forward, which can increase upper back discomfort.
- Relax Shoulders: Lower your shoulders and keep them relaxed, not elevated. Adjust your chair height or armrests so your shoulders remain in a neutral position to reduce upper back and neck tension.
- Raise Monitor Height: Elevate your laptop screen so the top of the screen is at or just below eye level. Use a monitor riser or stack sturdy books to achieve this, which will help reduce neck flexion and upper back strain.
- External Keyboard and Mouse: Use an external keyboard and mouse positioned at elbow height to allow your arms to rest comfortably at your sides and wrists to remain straight, minimizing wrist deviation and upper back load.

Final Advice

Your workstation setup is causing significant upper back and neck strain due to monitor height and poor elbow positioning. Prioritize raising your monitor and using an external keyboard/mouse. Addressing these issues will help reduce your pain and improve comfort. If pain persists or worsens, consult a healthcare professional.
